

# Scheduling Algorithm Criteria

- Turnaround time
  - Aims to minimise total time from process submission (to ready queue) to completion
- waiting time
  - time in the Ready queue

# First- Come, First-Served (FCFS) Scheduling

<u>Process</u>	<u>Burst Time</u>
$P_1$	24
$P_2$	3
$P_3$	3

- Suppose that the processes arrive in the order:  $P_1, P_2, P_3$   
The Gantt Chart for the schedule is:

- Waiting time for  $P_1 = 0$ ;  $P_2 = 24$ ;  $P_3 = 27$
- Average waiting time:  $(0 + 24 + 27)/3 = 17$

# FCFS Scheduling (Cont.)

Suppose that the processes arrive in the order:

$$P_2, P_3, P_1$$

- The Gantt chart for the schedule is:

- Waiting time for  $P_1 = 6$ ;  $P_2 = 0$ ;  $P_3 = 3$
- Average waiting time:  $(6 + 0 + 3)/3 = 3$
- Much better than previous case
- **Convoy effect** - short process behind long process
  - Consider one CPU-bound and many I/O-bound processes

# Example of Shortest Job First

<u>Process</u>	<u>Burst Time</u>
$P_1$	6
$P_2$	8
$P_3$	7
$P_4$	3

- SJF scheduling chart

- Average waiting time =  $(3 + 16 + 9 + 0) / 4 = 7$

# Example of RR with Time Quantum = 4

<u>Process</u>	<u>Burst Time</u>
$P_1$	24
$P_2$	3
$P_3$	3

- The Gantt chart is:

- Typically, **higher average turnaround time** than **SJF**, but better **response time**
- $q$  should be **large compared to context switch time**
  - $q$  usually 10 milliseconds to 100 milliseconds,
  - Context switch < 10 microseconds

# Example of Priority Scheduling (non-preemptive)

<u>Process</u>	<u>Burst Time</u>	<u>Priority</u>
$P_1$	10	3
$P_2$	1	1
$P_3$	2	4
$P_4$	1	5
$P_5$	5	2

- Priority scheduling Gantt Chart

- Average waiting time = 8.2

# Priority Scheduling w/ Round-Robin (preemptive)

- Run the process with the highest priority. Processes with the same priority run round-robin
- Example:

<u>Process</u>	<u>Burst Time</u>	<u>Priority</u>
$P_1$	4	3
$P_2$	5	2
$P_3$	8	2
$P_4$	7	1
$P_5$	3	3

- Gantt Chart with time quantum = 2
